Our Understanding of Requirements

Objective

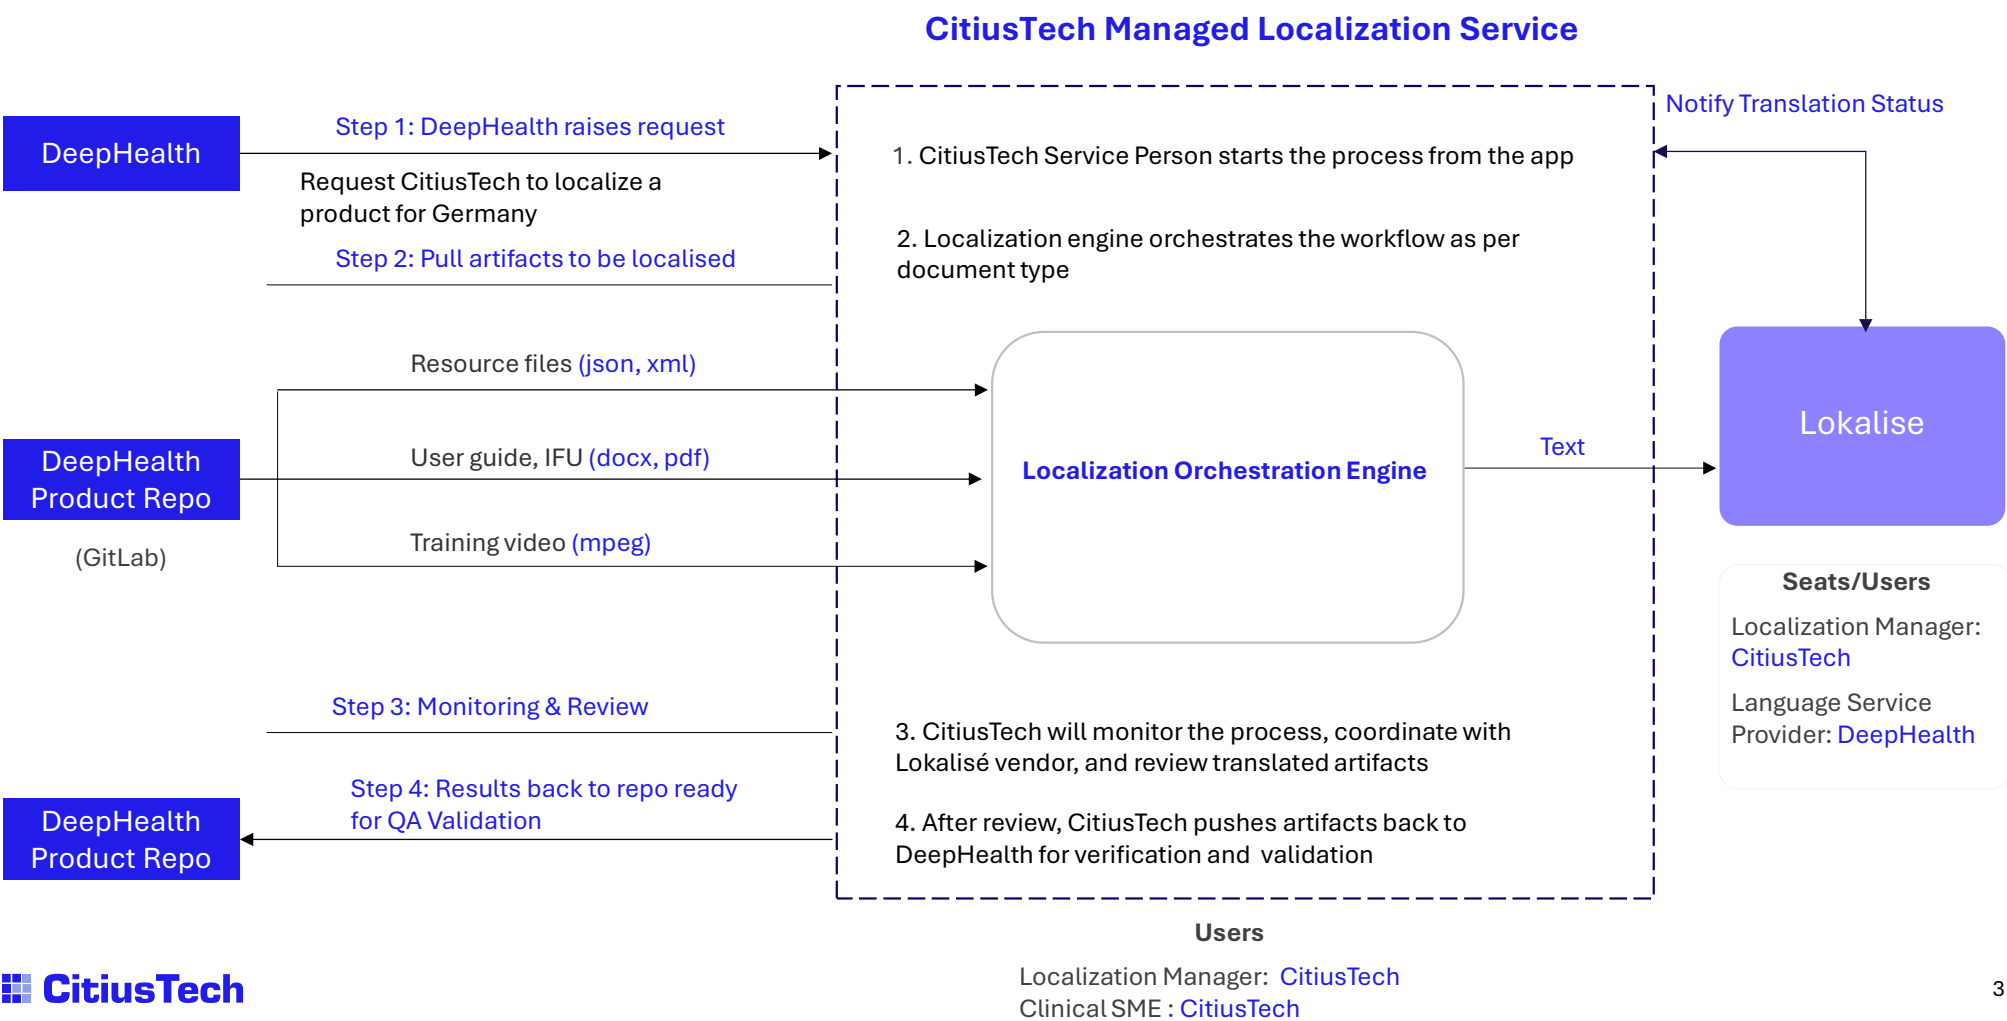

DeepHealth requires an end-to-end managed localization service that accelerates global healthcare product launches

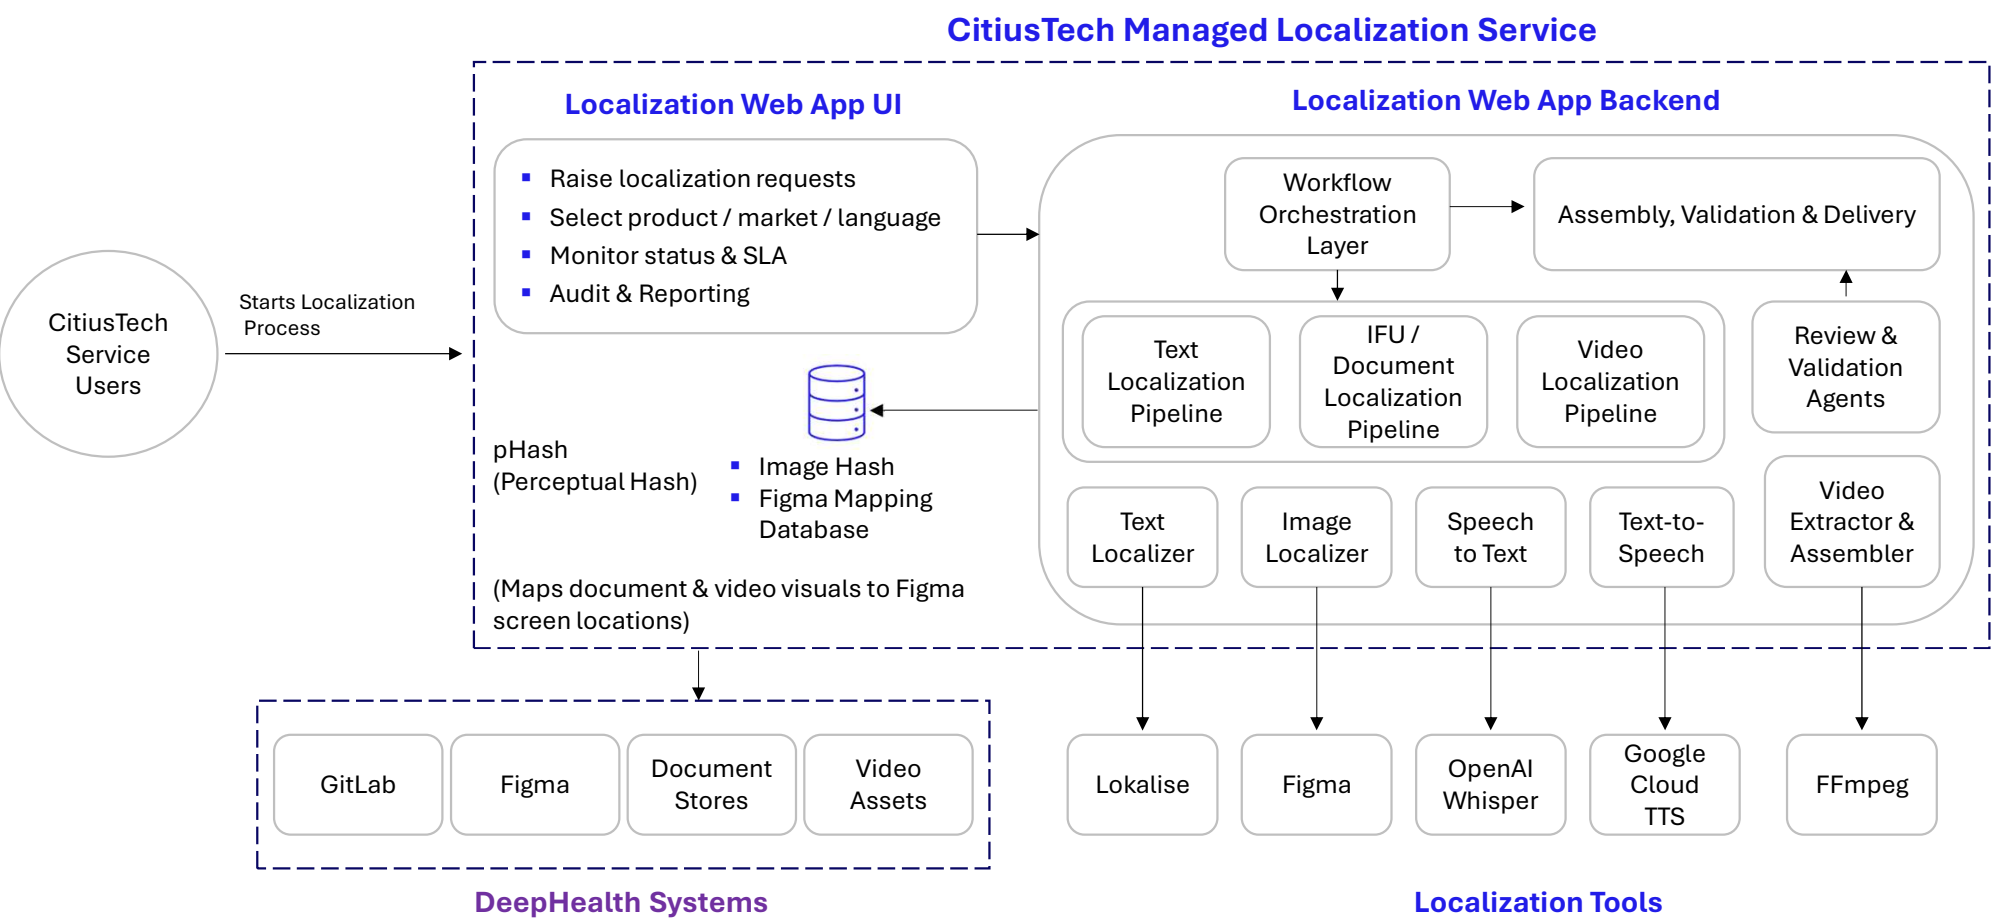

Our Understanding of DeepHealth Requirements

- DeepHealth requires a managed, end-to-end localization capability to accelerate global healthcare product launches while meeting clinical, regulatory, and linguistic standards
- The solution must support localization of complex artifacts such as IFUs, user guides, and training videos that contain mixed content (text, images, and media) and are not fully supported by standard translation tools
- The solution must enable consistent and coordinated processing of all content types within a single localization workflow, ensuring no loss of context or structure
- The solution must enforce mandatory human review and approval for all regulatory-critical content to ensure clinical accuracy, regulatory compliance, and language quality
- The solution must deliver fully assembled, validated localized artifacts, preserving original layout, structure, and intent, ready for QA and regulatory validation
- The solution must be operated as a managed service, providing the customer with a single point of accountability for quality, timelines, and compliance

Proposed Localization Workflow

Proposed Architecture Diagram

Assumptions and Dependencies

Product & Scope

- Localization is release-critical and planned as part of the product release lifecycle
- Initial scope includes UI resource files, IFU/Word documents, and training videos; advanced content types may be added later
- Video localization covers audio narration, subtitles, and design-based visuals, not advanced video editing.

Operating Model

- The solution is delivered as a CitiusTech-operated managed service
- Customers do not self-serve the system; all workflows are initiated and monitored by CitiusTech teams via the web application
- Lokalise acts as the translation and human review backend; CitiusTech owns orchestration, assembly, and delivery

Technology & Integration

- Lokalise is approved by the client for enterprise translation and human review workflows
- IFU and video images are assumed to originate from design sources such as Figma, enabling deterministic text extraction and re-rendering without OCR
- Video files are accessible in standard formats (e.g., MP4) compatible with Ffmpeg
- Speech-to-text and text-to-speech services are available for the required target languages

Review & Compliance

- Human review and approval are mandatory for all regulatory-critical artifacts
- AI is used only to assist and accelerate review (e.g., completeness, consistency, anomaly detection), not for final approval
- Final validation and sign-off remain the responsibility of trained reviewers

Access & Dependencies

- Timely access is provided to (Product repositories, Design assets (Figma), Video assets)
- Required credentials and approvals (Lokalise, Figma, cloud environments) are available early in the project
- Regulatory rules and country-specific requirements remain stable during a release cycle

Deployment Model

- The Localization Web Application and backend services will be deployed within the customer's environment (e.g., customer-managed cloud or approved hosting environment)
- CitiusTech will deploy, configure, and operate the solution as a managed service, while respecting the customer's security, compliance, and IT policies

Next Steps

Formal Approval & Scope Confirmation

- Obtain formal approval to proceed with the proposed scope and delivery timeline
- Confirm in-scope vs out-of-scope items (text, IFU, video; no advanced customization)
- Align on Phase-1 MVP scope for the first 2 months

Commercial & Contractual Finalization

- Finalize engagement model (managed service)
- Confirm pricing and billing cadence
- Sign required agreements (SOW, NDA, vendor agreements where applicable)

Deployment & Environment Readiness

- Confirm deployment model (customer environment)
- Identify target environment (cloud, region, account)
- Provision required infrastructure and access (Web app runtime, Backend services, Network access for external integrations)

Tooling & Integration Access

- Set up and approve access for Lokalise (projects, languages, reviewers)
- Figma (design files, APIs)Speech-to-Text / Text-to-Speech services
- Validate security and outbound connectivity requirements

Project Kickoff & Execution Planning

- Conduct formal kickoff with all stakeholders and align on milestones, review cadence, and escalation paths
- Finalize (Ownership model, Communication plan, Reporting cadence)

Content & Data Readiness

- Identify initial products and artifacts for localization
- Confirm availability of (Resource files, IFU documents, Video assets, Design sources (Figma))
- Establish content handoff and versioning process

Thank You

CitiusTech - Shaping Healthcare Possibilities.

CitiusTech is a global IT services, consulting, and business solutions enterprise 100% focused on the healthcare and life sciences industry. We enable 140+ enterprises to build a human-first ecosystem that is efficient, effective, and equitable with deep domain expertise and next-gen technology.

With over 7,700 healthcare technology professionals worldwide, CitiusTech powers healthcare digital innovation, business transformation, and industry-wide convergence through next-generation technologies, solutions, and products.
